

**TP** mechanical tilting plate allows, depending on the mounting orientation, a mechanical down or up tilting up to 45 degrees. The tilting angle is continuously adjustable. It can be also used to adjust the antenna orientation on a horizontal plane when the antenna is mounted on a horizontal pole.

The mechanical beam tilting plate is mounted between the original antenna mount and the pole with 4 pcs of M8 bolts and self-locking nuts supplied with the tilting plate. Original V-bolts supplied with the antenna are used to mount the beam tilting plate to the pole.
